Q: Silverlight and XML I have just developed an application for my company in C# using Silverlight 3. It loads a xml object from a file and displays it within the silverlight application (simple page with text). I have now created a new website for my company and I need to create a new site with a Silverlight application that loads a different xml object and displays it. I need to change the code a little bit, to the xml object and the page layout but I am just wondering what the best way to go about it would be. The one idea I have is to put the new xml object in the same web xml and simply change the xml object that is being loaded. This seems the simplest way but I'm not sure if this would work with Silverlight. Is there any other way to go about this? Perhaps creating a new silverlight application for each xml object? A: Creamy, you need to take a look at the XAP file! There's a single XAP that contains your Silverlight code and all the resources needed to run it. The XAP is what we actually deploy to the client. When you load this XAP file, the Silverlight code can start executing and do a lot of things, including obtaining information from you Silverlight application and the XAP itself. Once that's done, the XAP is eventually able to do its job of returning XML data to the Silverlight application. And this XML data is then used to create the content for a Silverlight page. So, your XML data (for example) could be stored in a Content property on your XAP. This Content is then later used to populate the Silverlight page, which is much more powerful than just having the XML data in-memory. Q: What does "déjà la montagne" mean? I have heard the term "déjà la montagne" used a few times on TV dramas in French, usually about war stories. The context I think I understand it, but I'd like to know if there's any real meaning to it. I have tried googling it, but the results are mostly about mountains and glaciers and not about people. The context I heard it was a story where a woman, who had had an affair with a soldier for twenty years, turned him into ashes but he didn't know she existed. She

To use the Clone Stamp, select a tool such as a soft brush or a faux painting tool. Then, click and drag to select an area of an image. To erase the selected area, click the Stamp button at the bottom of the Toolbox. To apply the Stamp to a new area, simply drag a new selection onto the image. To select a larger area, click with your mouse outside of the image. To select an even larger area, use the Spacing slider to set the maximum spacing between points. To get an overview of the Clone Stamp tool, double-click the tool to open the Brush Controls in a separate window. The Eraser tool allows you to erase individual pixels and selections to change the look of an image. To erase an image, click and drag the Eraser tool, or use the Eraser tool's Brush box. To work on just selected pixels, hold down the Ctrl or Shift keys while erasing. To erase a selection, click the Erase menu item in the toolbox. To remove a stroke or paintbrush tool, double-click the tool to open the Brush Controls in a separate window. The Gradient tool enables you to apply colors in an image by using gradient fills. You can draw gradients in a new image to match the look of an existing image or to create your own unique gradients. The Gradient tool has two areas: the Fill box and the Stroke box. You can use any Photoshop color as a fill. The area you're filling should always be darker than the area you're stroking. When you stroke, it's useful to think of the direction of the stroke as the stroke "flow." You can control the strength of the stroke with the Stroke box. You can also stroke with color gradients by using the Stroke Color Overlay tool. You can use various masking tools to apply effects, including filling an image with a color gradient, creating a stroke to simulate a brush stroke, or hiding certain areas of an image. You can draw a selection around a problem area, and then use the Adjustment panel to determine how you'll fix the problem area. The Layer Style panel is a folder of tools that work like filters. You can apply layer styles to single or multiple layers in the current document. Layer styles can simulate almost any effects: drop shadows, glows, bevels, reflections, or overlays. You can drag the Quick Mask or Eyedropper tools from the tool
